

Evidence is more reproducible at module than individual-gene level

Module support is more reproducible; candidate genes and specificity remain source dependent

	PRJNA607098	GSE130973	GSE300230	GSE338388	GSE276045
Module level	Core modules 2/2; both positive in 12/12 samples	Integrin and actomyosin positive in 5/5 subjects	Actomyosin significant in 2/2 cell lines; integrin in 1/2	TEAD inhibition decreased integrin, actomyosin and Hippo/YAP/TAZ	Actomyosin stiffness slope significant in 2/2 models
Candidate level	10/15 supported; integrin 5/6; actomyosin 4/4	Integrin 5/6; actomyosin 1/4	8/15 positive in both lines; 0/15 $q \leq 0.05$ in both	Candidate coverage 15/15	Candidate coverage 15/15

Evidence class

- Strong module support
- Partial/conditional
- Discordant/source-dependent
- Not confirmatory

Colours summarize prespecified or explicitly bounded evidence classes; they are not a formal universal grading scale.
